

ChargeGuard Enabled HCS INSTRUCTIONS

Please refer to these instructions to operate the ChargeGuard enabled HCS EVSE:

1. Connect the HCS EVSE to the vehicle with the SAE-J1772™ connector.
2. Insert the key into the switch located on the right side of the HCS EVSE and turn the switch 90° clockwise. The “CHARGING” LED light will illuminate green on the front panel, indicating the vehicle is now being charged. Once charging begins:
 - a. Leave the key switch in the present position. This allows disconnection of the EVSE from one vehicle and reconnection to the same or another vehicle without moving the key switch. The station will be enabled and power will be available to vehicles as long as the key is in this position.

NOTE: the key cannot be removed in this position, see step B below for key removal instructions.

- b. Turn the key switch counterclockwise 90° and remove the key. This allows the vehicle to charge as long it is connected to the EVSE and needed. This will enable the station for as long as it is connected to the vehicle. Once disconnected from the vehicle the station will require the key to activate another charging session.

To charge another vehicle, either repeat steps 1 & 2 or select option A above before disconnecting your EVSE from the vehicle.
